

RouteGuard AI

Spot Supply Chain Problems.
Use Your Trucks Better.

From warning signs → to clear, confident decisions.

Problem L2 | Prototype presentation

When one disruption creates many problems

Everything in a supply chain is connected. One event can affect shipments, routes, trucks, and product safety.

01

Disrupted routes

Bad weather, closed ports, or world events can block planned routes.

02

Idle fleet capacity

Some trucks and containers sit unused while others are overloaded.

03

Cold-chain risk

Temperature changes can put medicine and fresh food shipments at risk.

04

Slow decisions

Teams need a faster way to see what matters most and decide what to do next.

One dashboard. Clear priorities. Faster action.

RouteGuard AI brings problem alerts, fleet tracking, cold-chain warnings, and an AI helper together in one place.

Identify

Which shipments are affected, and how urgent

Recommend

Reroute or check another carrier

ROUTE GUARD

Operations dashboard

24

Affected

08

Idle assets

03

Cold alerts

Recommended next action

Redeploy

Find trucks that aren't being used

Protect

Flag risky temperature changes

A simple path from problem to action

The prototype lets you pick a disruption scenario and instantly see its impact.

Scenario: Port Alpha is closed

Follow one story to see how RouteGuard AI turns a disruption into a clear, ranked response.

Demo takeaway: see the disruption → understand the impact → decide what to do next.

From data to decisions

How data flows: the dashboard connects real data with decision rules and an AI helper.

The data used here is made up for the demo — it's not a live logistics system.

BoB: our AI coding partner

The project uses BoB to understand, build, refine and review the prototype.

- 1 Understand** Look through the code and understand how the project is organized.
- 2 Plan** Break the requirements into features we can build.
- 3 Build** Use Agent mode to build and improve app features.
- 4 Review** Check the finished work against the requirements.
- 5 Document** Write down the prompts and steps we used, in BOB_PROMPTS.md.

Important: only say IBM watsonx is connected if it's actually connected and tested.

Make it easier to see and act on disruptions

The prototype is a starting point for faster decisions.

Faster

Identify disrupted shipments
sooner

Smarter

See unused trucks clearly

Safer

Detect cold-chain risk earlier

What's next

- Connect to real logistics and carrier data
- Add live sensors to track cold-chain temperature
- Add a real IBM watsonx AI helper once we have access

A focused 90-second story

Keep the live demo simple: one disruption, three views, one clear takeaway.

Open dashboard

Start at the main screen

Select scenario

Trigger the disruption

Show shipments

Highlight affected and urgent cargo

Open Fleet

Show idle trucks

Open Cold Chain

Show high / critical alerts

Ask Copilot

Ask one or two quick questions

End with the value: one place to see the disruption and decide what to do.

Thank You

RouteGuard AI

See the disruption.
Understand the impact.
Take the next action.
